

Take-Home Assignment

Candidate: Shweta Choori

Role: Product Analyst Intern

Submission: Orders API — Data Quality Review

TASK 1

What Doesn't Match?

ISSUE	EVIDENCE / MISMATCH	IMPACT
Incorrect total – <code>ord_1004</code> <code>orders_page1.json</code>	The documentation says <code>total = subtotal + tax + shipping</code> . However, $6200 + 511 + 599 = 7310$, while the returned total is 6810. This can directly cause incorrect financial calculations.	YES Can directly affect financial calculations.
Incorrect monetary format – <code>ord_1006</code> <code>orders_page2.json</code>	The documentation says monetary values are integers in the smallest currency unit. This order instead contains decimal values such as 44.0, 3.63, 5.99, and 53.62. A client following the documentation could interpret these values incorrectly.	YES A client may interpret values using the wrong unit.
Pagination inconsistency – <code>orders_page1.json</code>	The response says <code>has_more: false</code> , but provides a <code>next_cursor</code> , and <code>orders_page2.json</code> contains two additional orders. A client following the documented pagination logic could stop early and miss orders.	YES A client may stop early and miss an entire page of data.
Missing-order response – <code>order_ord_9999.json</code>	The documentation says a nonexistent order returns HTTP 404, but the supplied response is HTTP 200 with <code>order: null</code> . Clients expecting a 404 may handle this incorrectly.	YES Clients expecting 404 may not handle the response correctly.
Missing customer email – <code>ord_1005</code> <code>orders_page2.json</code>	The documentation says customer email is always present, but the actual value is null.	YES Systems assuming a non-null email may fail or produce incomplete data.
Undocumented status – <code>ord_1003</code>	The response contains <code>status: refunded</code> , although the documented statuses are only <code>pending</code> , <code>shipped</code> , <code>delivered</code> , and <code>cancelled</code> .	YES Client logic may not handle a status outside the documented set.

MOST SERIOUS ISSUE

The pagination inconsistency is the most concerning because it can silently cause a client to miss an entire page of orders. This could lead to incomplete datasets and incorrect reporting.

TASK 2**What's the Total Revenue?**

The supplied total fields sum to **\$328.03**, treating `ord_1006`'s 53.62 as \$53.62 because its values are presented in decimal currency despite contradicting the documented format.

However, I would not treat **\$328.03** as a definitive accounting revenue figure. `ord_1004` has a total inconsistent with its components, and the documentation does not specify whether the refunded `ord_1003` should be included in revenue. I would need the intended revenue treatment for refunded orders and confirmation of the correct `ord_1004` amount.

TASK 3A**Reply to Priya**

To: Priya
From: Shweta
Re: Revenue discrepancy in the Orders API data

Hi Priya,

I found inconsistencies in the order data that can explain the revenue difference. The supplied order totals add up to \$328.03, but `ord_1004` has a total that does not match its subtotal, tax, and shipping, while `ord_1006` uses a different monetary format from the documented API format.

There is also a refunded order, but the API documentation does not specify whether refunded orders should be included in revenue. Because of these issues, I would not treat \$328.03 as a definitive accounting figure until they are clarified.

Best,
Shweta

TASK 3B**Bug Report**

BUG `/v1/orders` reports no more pages when another page exists

WHAT TO LOOK AT `has_more` and `next_cursor` in `orders_page1.json`.

ACTUAL The response returns `has_more: false` with `next_cursor: "cur_8f2a19bd"`, while `orders_page2.json` exists and contains `ord_1005` and `ord_1006`.

EXPECTED If another page exists, `has_more` should be `true` and the response should provide the cursor required to retrieve it.

IMPACT A client following the documentation could stop after the first page and silently miss orders, potentially producing incomplete or incorrect revenue reports.
